

## AUTOMATIC MILK MANAGEMENT

### Fully automatic process from cow to calf

We offer you a solution for easy automatic fresh milk feeding, consisting of a **SmartTank** and **Automatic Calf Feeder**. These components can be put together quite individually and can incorporate already existing components in farms!

The concept of automatic milk management is based on the idea of providing high quality milk to the calf directly from the udder.

The milk is directly transported to the SmartTank, which retains the valuable quality of the milk and provides it fresh to the automatic feeder. The Automatic Milk Management also allows more flexible work processes.

#### Advantages:

- Easy fresh milk feeding
- No more buckets to be carried
- More flexible work processes and time savings
- Optimized calf health through very good hygiene
- High milk quality
- Easy integration into any farms

Milking System

Calf

## SmartTank

The SmartTank with a capacity of 100 or 300 l cools milk efficiently, without icing of residual quantities. It is easily controlled via the automatic feeder and is automatically cleaned together with all milk-carrying components, which provides you with the benefits of less work and a more efficient cleaning process.

## Automatic Calf Feeder

Our automatic feeder supplies up to 120 calves around the clock with freshly prepared, exactly dosed milk at an optimum temperature. In addition, the CalfCloud and CalfApp provide you with an overview of the feeder consumption documentation. Feed your calves according to their needs from the very first day, to create perfect conditions for a healthy and strong herd of cows.

## Testimonial

### Testimonial of Jonathan Bürkle:

„We have decided on the Automatic Milk Management system from Förster-Technik for further automation of our calf feeding system. This saves us a great deal of work and avoids the tedious manual transportation of the milk. Our calves are optimally fed and are much more healthy.“

*Farm Bürkle in Germany  
Automatic  
Milk Management  
In use since June 2018*

### Testimonial of Matthias Ackermann:

„For our organic farm we were looking for a cheap alternative and decided to use the Automatic Milk Management from Förster-Technik. Here, the fresh milk is transported from the milking robot to the calf barn in an underground pipe. This is a great relief for us as a family and also for the employees. The physical work is less, you need much less time and also the group housing with the automatic feeder works very well. The calves in groups learn better social behavior and the work is also much easier for us.“
